

Meeting Saudi Arabia's Carbon Mitigation Goals: Some Preliminary Findings

Douglas Cooke Program Director

Introducing KAPSARC

- The King Abdullah Petroleum Studies & Research Center (KAPSARC) is an independent, non-profit research institution located in Riyadh, Saudi Arabia
- Its mission is to advance energy economics insight and to catalyze effective energy policy dialogue
- Research focuses on energy policy, economics, technology and environmental issues
- Currently over 60 researchers, expanding to over 100 in 2017

The Strategic Policy Challenge

- Paris Accord took a decentralised approach to drive global collective action
- But the sum of nationally determined contributions to date is insufficient to meet currently agreed global goals
- A more practical policy approach is needed to help close the gap

Practical Climate Change Policies Research Project

- KAPSARC and IEEJ are undertaking a joint research project to examine more practical approaches to climate change policy
- Key elements of the project include:
 - Developing efficient global pathways that incorporate mitigation and adaptation
 - Examining nationally optimal approaches that reflect local starting points and how they might be influenced by stakeholder interests

Project Methodology

Step 1

 Calculate efficient global pathways for meeting agreed global emission outcomes/targets

Step 2

 Establish "emissions envelopes" at the country (or regional) level

Step 3

 Identify and evaluate potential country-specific policies and assess impacts

Step 4

 Explore how stakeholder interests may influence the choice of polices and their implementation at a country-level

KAPSARC's Saudi Arabian Carbon Mitigation Research Project

Objective

- To identify economically optimal policies and pathways to meet Saudi Arabia's NDC and assess their impacts; and
- Explore how internal stakeholder interests may influence the choice of policies and their implementation

Study methodology

 Quantitatively assess least cost pathways for Saudi Arabia to achieve its NDC under the Paris Accord

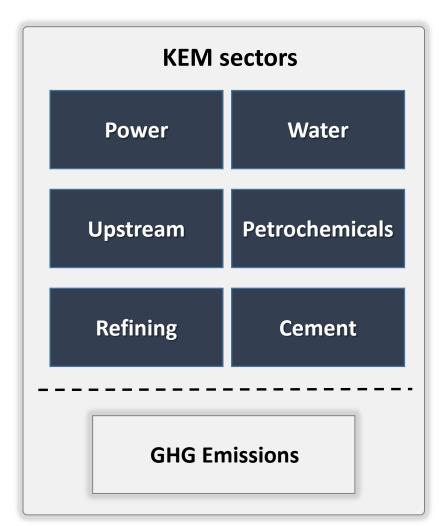

Policy options

- Carbon pricing
- Capital subsidies
- Industrial input fuel price deregulation

Analytical Framework

- Analysis uses the KAPSARC EnergyModel of Saudi Arabia (KEM)
- Partial-equilibrium model for six integrated industrial sectors
- KEM seeks to minimizes costs associated with meeting demand from these sectors
- Analysis focuses on the power and water sectors (including interaction of other sectors)

Saudi Arabian Energy Sector Overview

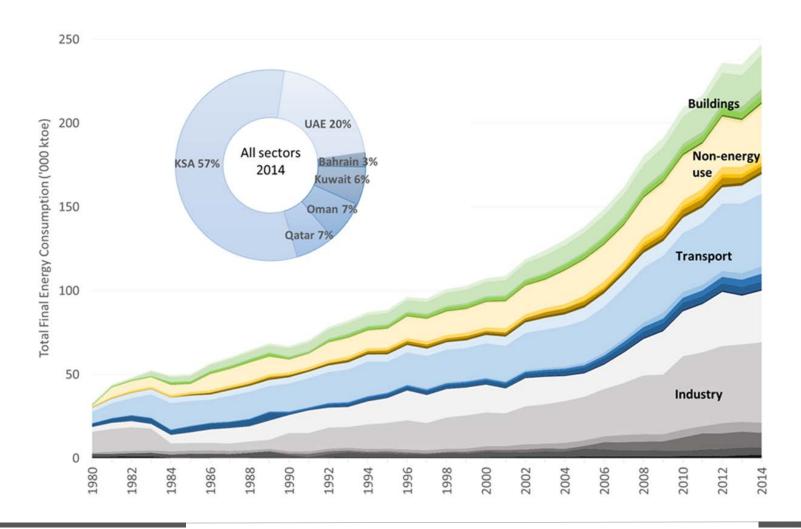

- Primary energy supply: 213.51 Mtoe
- Oil production: 552.9 Mtoe
- Petroleum exports: 429.65 Mtoe
- Final energy consumption: 141.69 Mtoe
 - Electricity: 290.66 TWh
 - Electricity sector operation and development is greatly influenced by the water sector (desalination)
- Population: ~ 31 million (2015)
- Carbon emissions: 506.59 MT CO2e

Saudi Arabia Drives Regional Energy & Carbon Emissions Growth

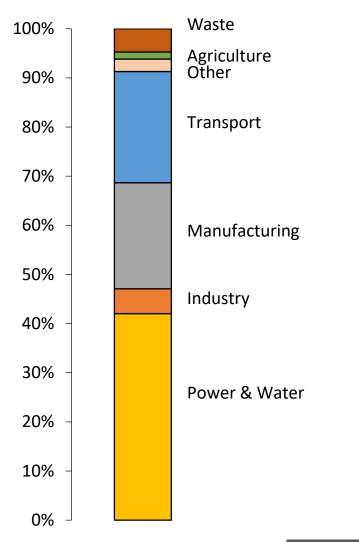

Sources: IEA and Enerdata

Saudi Arabia's Carbon Mitigation Goals

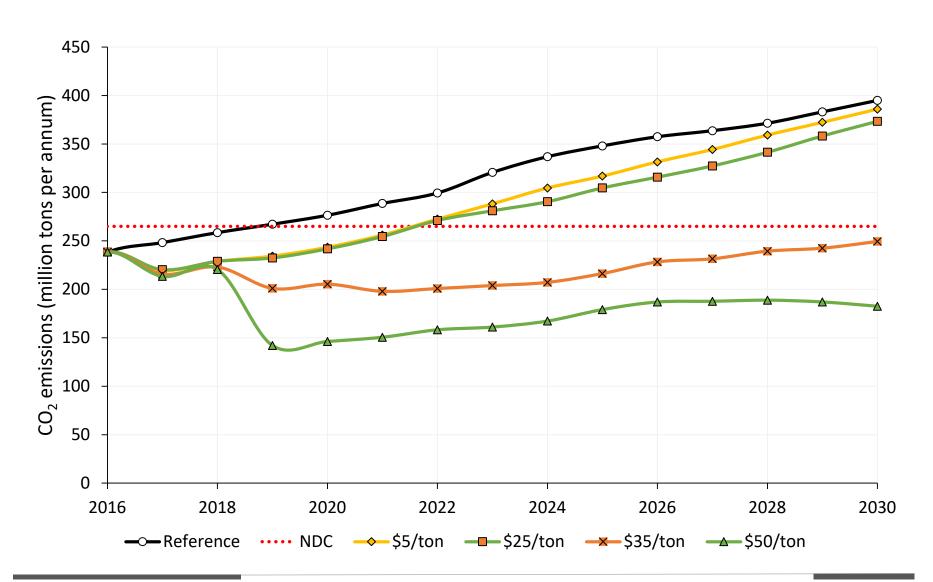

- Nationally Determined Contribution target of 130 million metric tons of CO₂ equivalent by 2030
- Greenhouse gas reductions viewed as co-benefits of economic diversification activities
- Mitigation measures include:
 - energy efficiency
 - renewable energy
 - carbon capture & utilization/storage
 - increased use of natural gas
 - methane recovery

Carbon Emissions by Sector (2015)

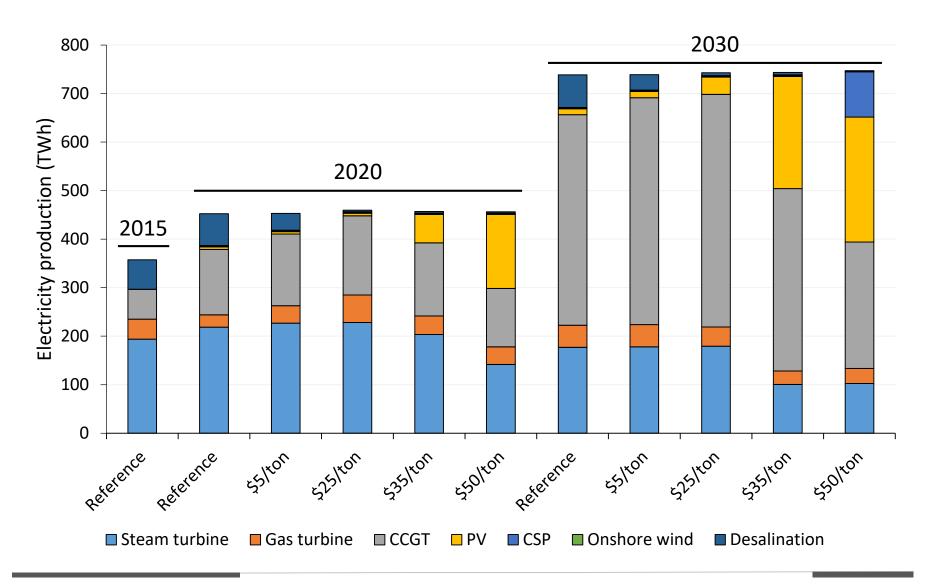

Carbon Pricing: Carbon Emissions

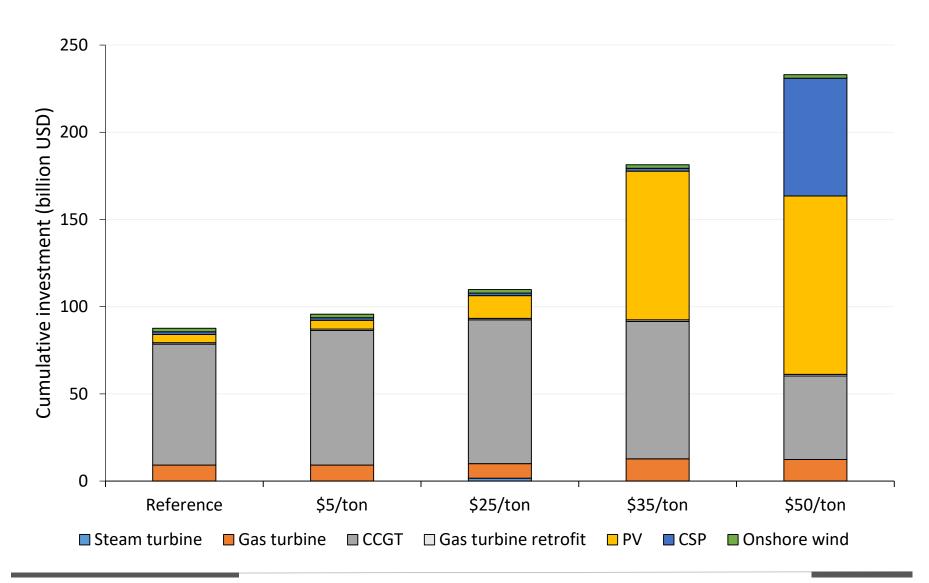

Carbon Pricing: Electricity Production

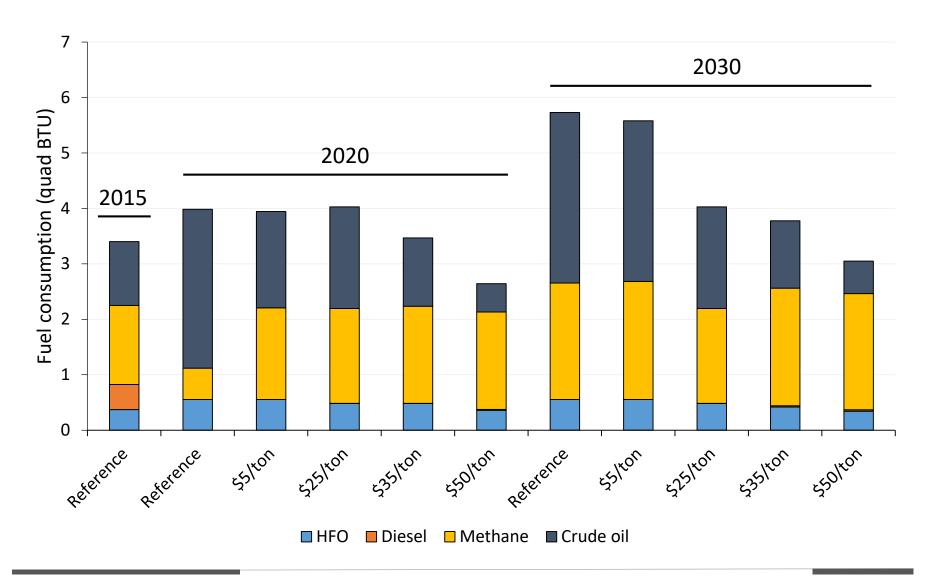

Carbon Pricing: Capital Investment

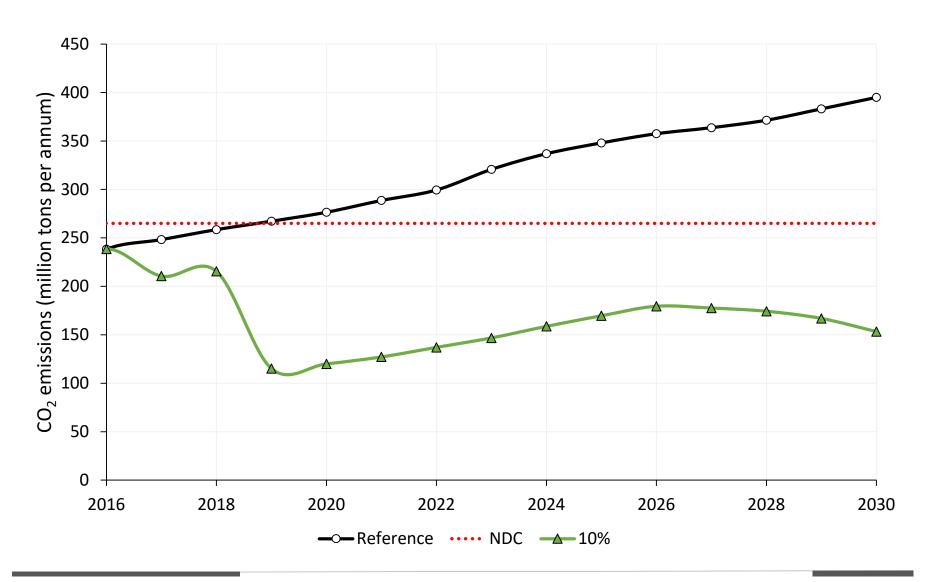

Carbon Pricing: Fuel Mix

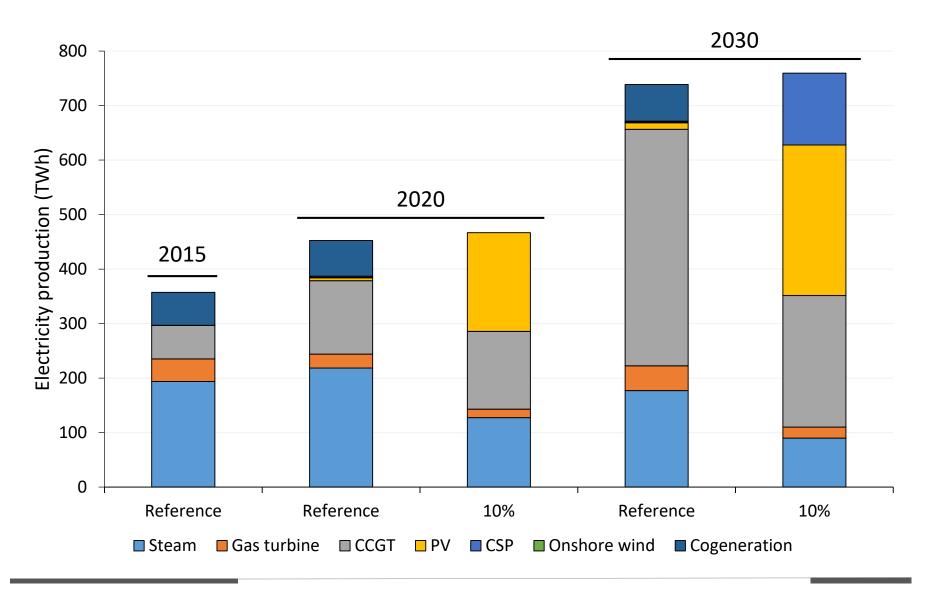

Capital Subsidies: Carbon Emissions

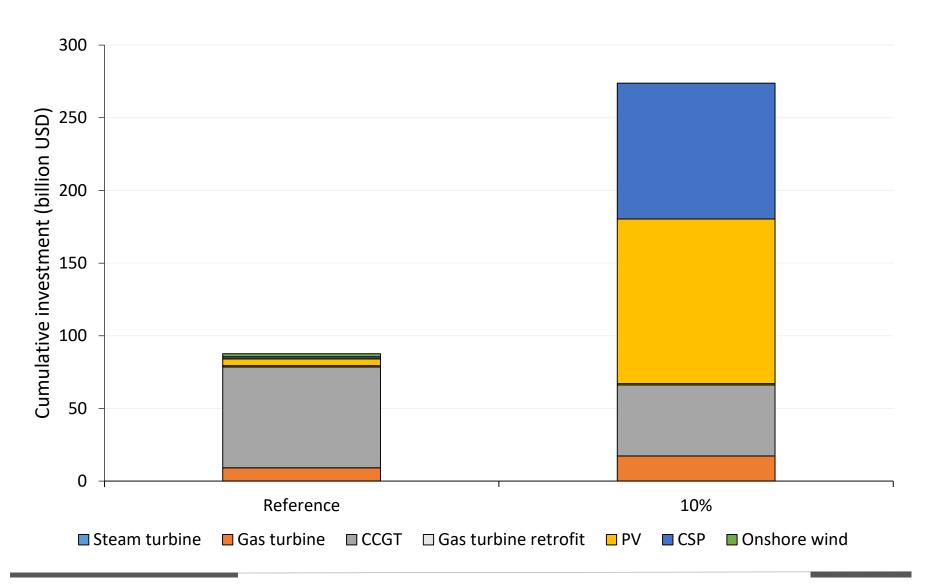

Capital Subsidies: Electricity Production

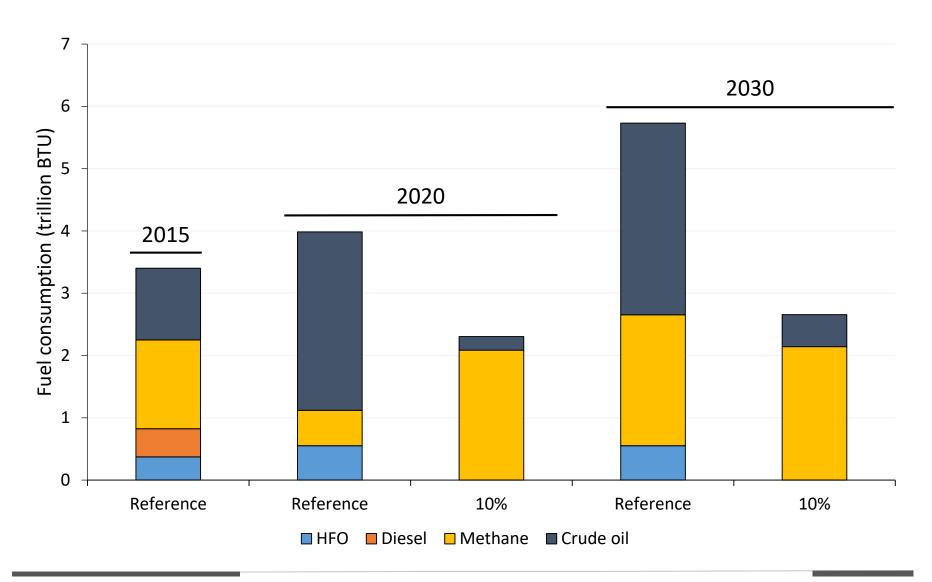

Capital Subsidies: Capital Investment

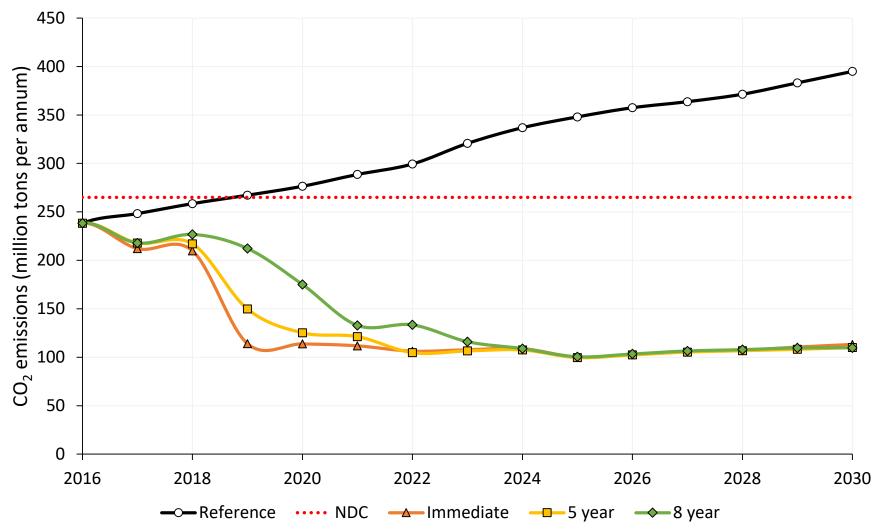

Capital Subsidies: Fuel Mix

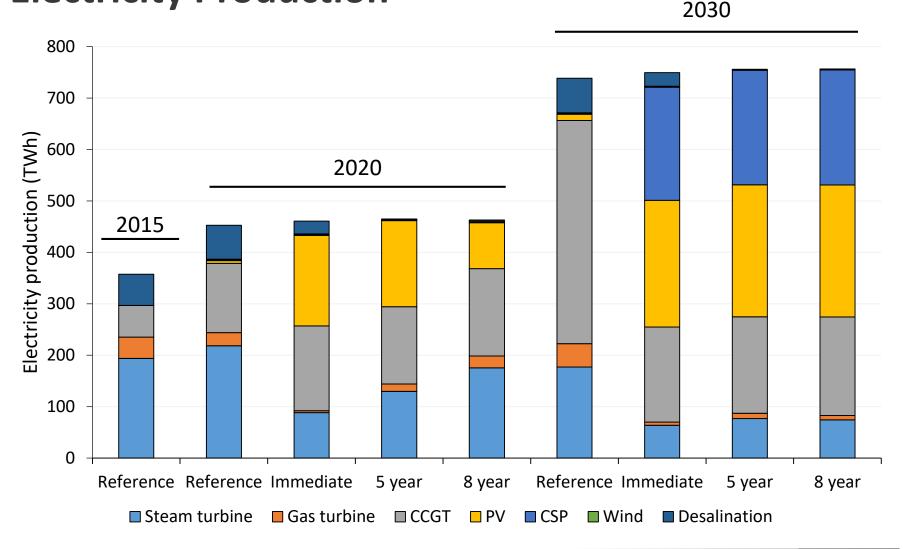

Industrial Input Fuel Price Reform:

Carbon Emissions

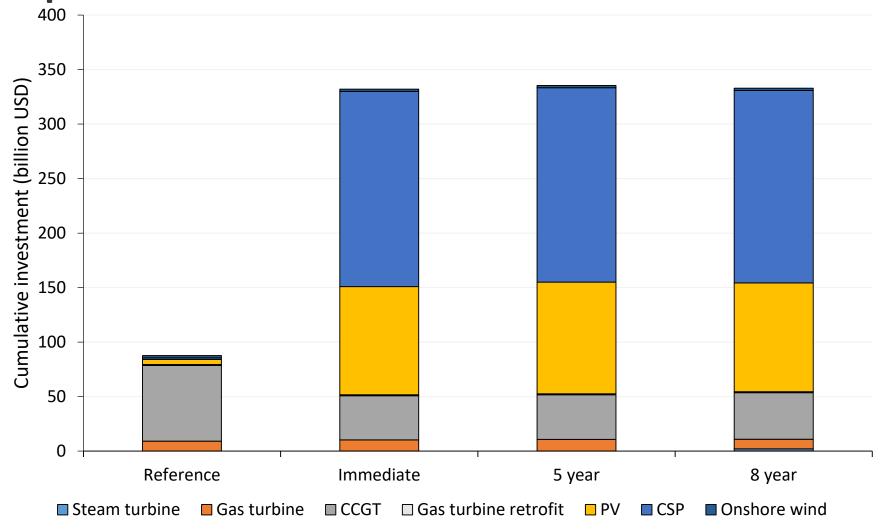

Industrial Input Fuel Price Reform: Electricity Production

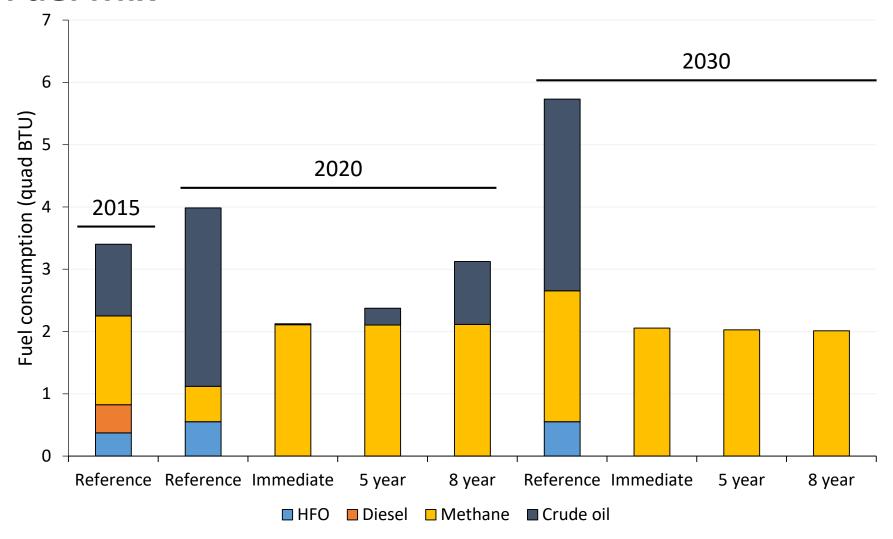

Industrial Input Fuel Price Reform: Capital Investment

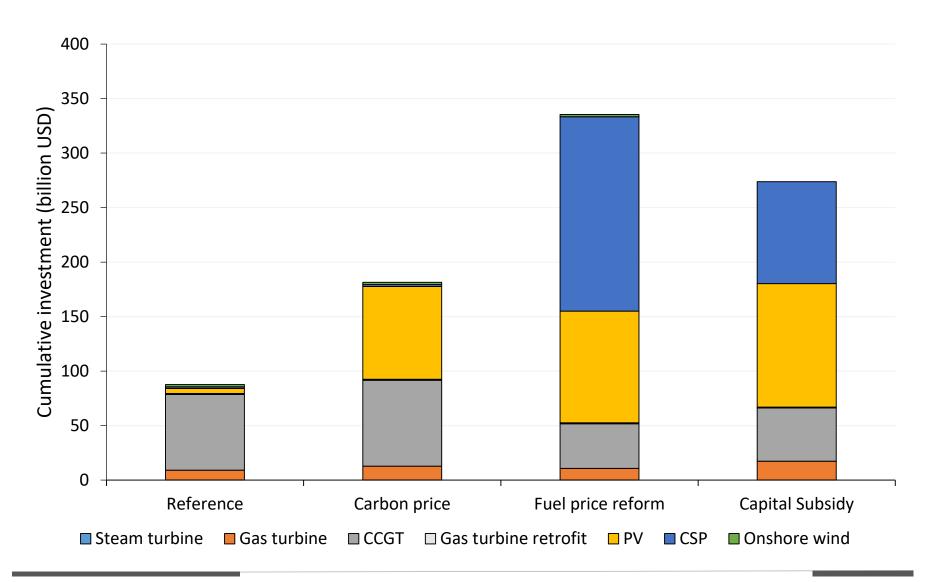

Industrial Input Fuel Price Reform:

Fuel Mix

Some Preliminary Comparative Results

Anticipated 2017 Milestones

Publications:

- Potential practical carbon policy options & pathways for Saudi Arabia
- Potential practical carbon policy options & pathways for Japan
- Optimal global emission pathways including mitigation & adaptation

Research:

- Incorporate bargaining & macroeconomic analysis
- Expand study framework to examine China, India and the Gulf Cooperation Council states
